AGENT FACTORY

# How the reminder and communication service works

Consent-first reminders by SMS, voice and email, with an AI receptionist on the same stack

## The problem we solve

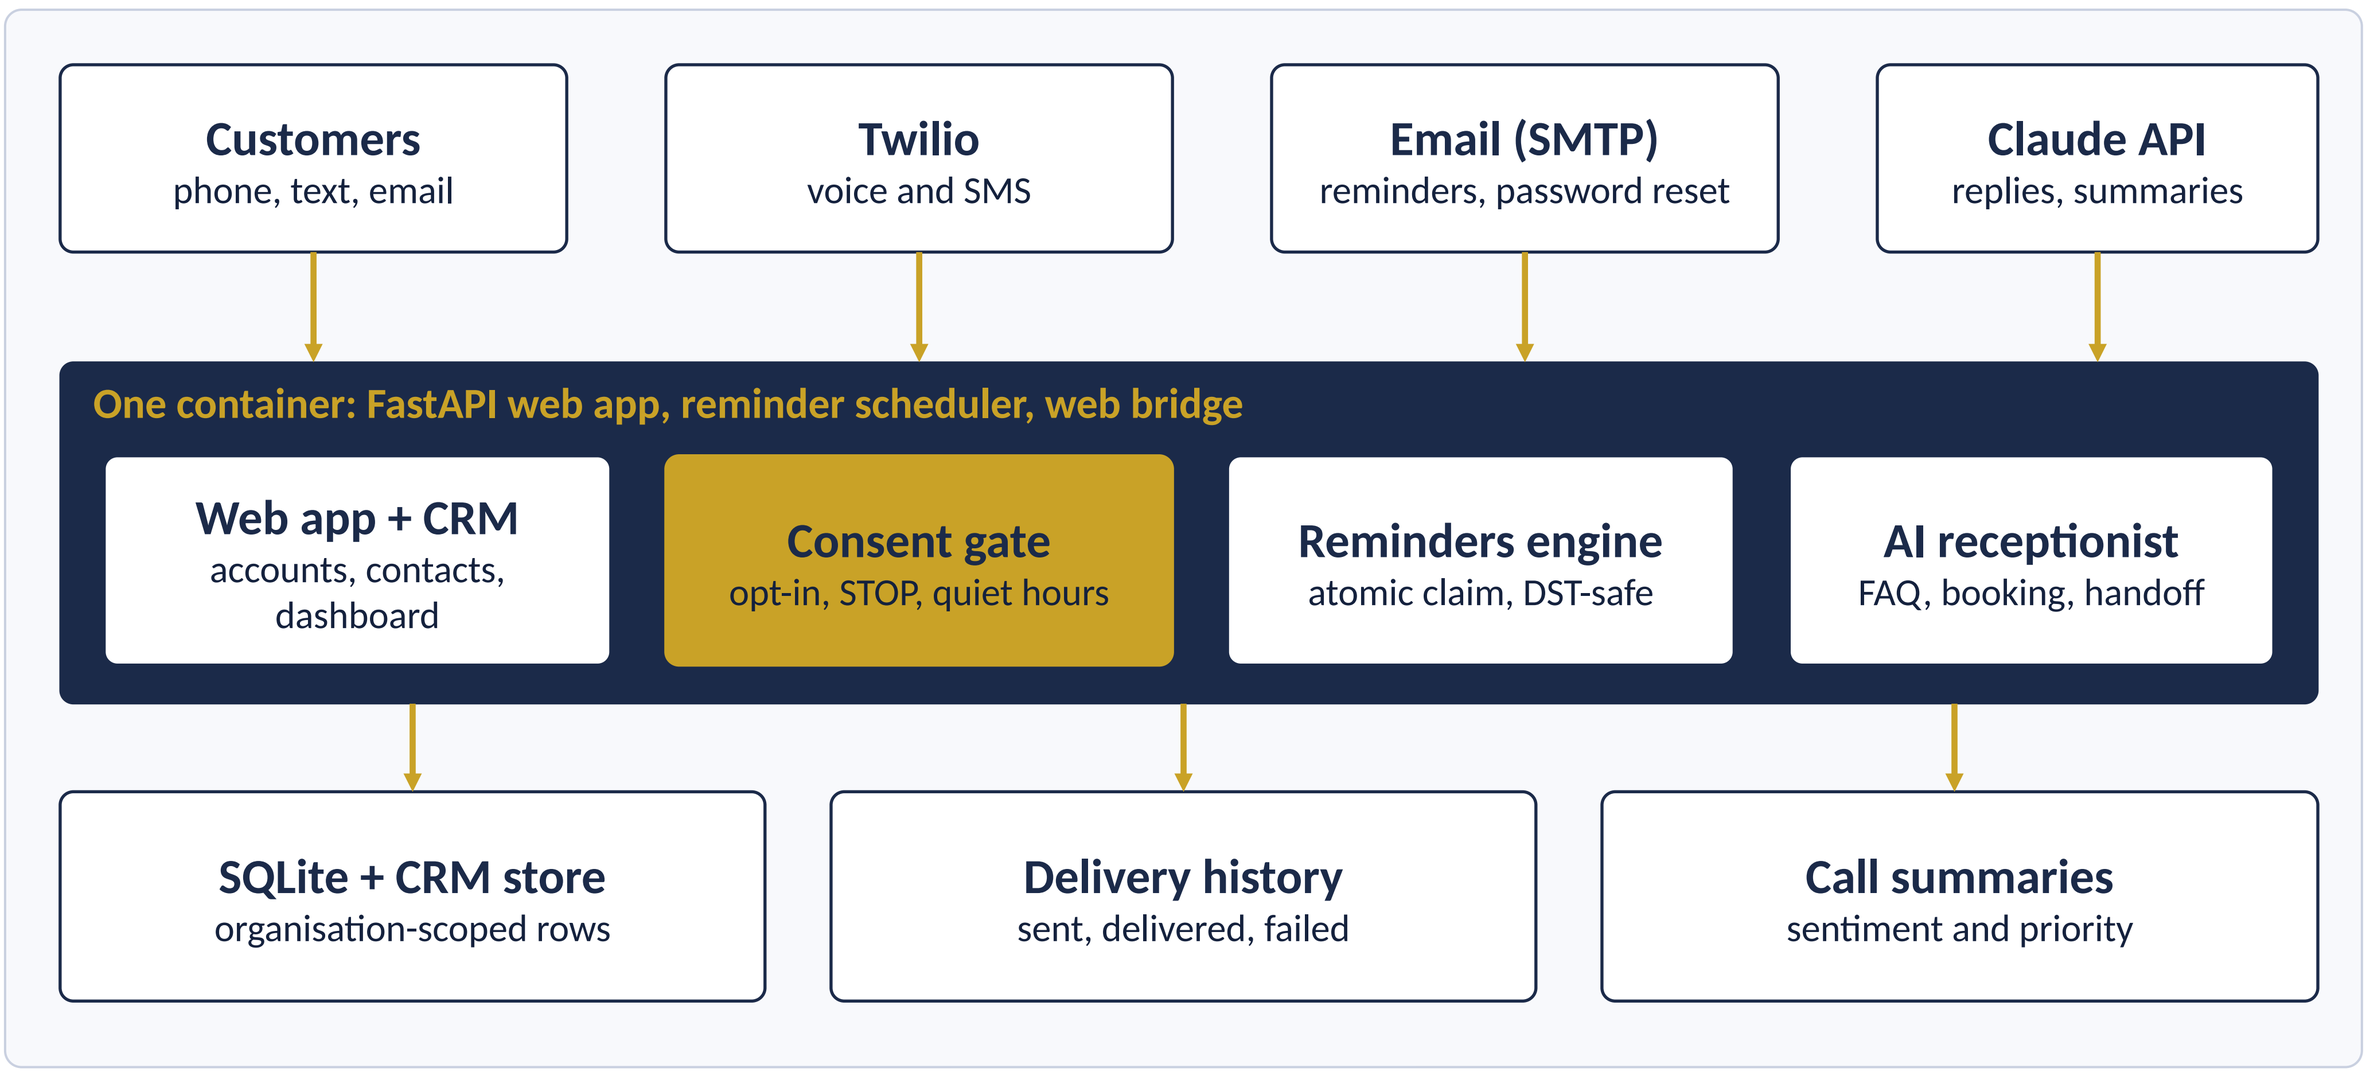

Clinics, salons and trades lose money to no-shows and spend hours phoning people.

Our client wanted a service they can trust: every message respects consent, and customer data stays under their control.

## What it does

- Organisations register and manage contacts
- Schedule one-off and recurring reminders
- Deliver by SMS, voice and email
- Answer calls with an AI receptionist

## Architecture

## Where it runs

**Target: on-premise edge**
A machine the client controls. Data stays on their disk.

**Poster demo: Render free plan**
Cloud, US region, fictional demo data only

## Why it is a good solution

- Consent before every send: no opt-in, no message. STOP works on its own.
- Each organisation sees only its own data.
- A reminder is claimed once, so it can never double-send.
- Recurring times follow the local clock through daylight saving.

## How we know it works

- 516 automated tests, run by CI on every change
- Secrets audit and Docker smoke test in CI
- Webhooks are signature-checked; forged calls get 403
- A real phone call was answered by voice on the live app

**Known limits:** SMS to US numbers waits on carrier registration. The demo is cloud-hosted.
